Let keyword in javascript :-

Let keyword is used to declare a block scope variable . block scope variable means they are only accessible within the block or statement .

Variables which are declared inside flower bracket { } they can only access within that flower bracket only , we cant use it outside the flower bracket.

```
{

    Let x = 3      // we can access x value only inside this block

}

// we cant take x value here
```

For Example : -

```
<script>
Function LetKeyword ()

  {
      Let x= ' I am block scoped '

  console.log(x)

}

LetKeyword()
</script>
```

Output :-

I am block scoped
